How to separate the classes from a file named Maze-game.py, into separate files for the classes, then to re-import the classes into the Maze-game-main.py ?

Alright, you want to **split your big Maze-game.py** into **separate files** — one file for each class — and then **import them** into your new main file **Maze-game-main.py**.  
Super clean idea. 🚀 Here's a step-by-step for you:

---

## 1. Create a folder structure

---

Suppose you have classes like **Maze**, **Player**, and **Enemy**.  
You could organize it like this:

arduino

```
Maze-game/  
├── Maze-game-main.py  
├── maze.py          # for Maze class  
├── player.py        # for Player class  
├── enemy.py         # for Enemy class  
└── __init__.py     # (optional, but good practice)
```

| `__init__.py` can be an empty file. It just tells Python "this is a package."

---

## 2. Move each class into its own `.py` file

---

For example:

In `maze.py`:

```
python
```

```
class Maze:  
    def __init__(self):  
        pass  
    def display(self):  
        print("Displaying maze")
```

In `player.py`:

```
python
```

```
class Player:  
    def __init__(self):  
        pass  
    def move(self):  
        print("Player moved")
```

In `enemy.py`:

```
python
```

```
class Enemy:
    def __init__(self):
        pass
    def attack(self):
        print("Enemy attacks")
```

---

### 3. In your **Maze-game-main.py**, import them

---

Now your **Maze-game-main.py** will **import** like this:

```
python
```

```
from maze import Maze
from player import Player
from enemy import Enemy

# Then you can use them:
maze = Maze()
player = Player()
enemy = Enemy()

maze.display()
player.move()
enemy.attack()
```

---

### 4. (Optional) Make it even cleaner with a **classes/** folder

---

If you want to be extra organized, you could put all the class files into a **classes/** folder:

```
css
```

```
Maze-game/
|
|— Maze-game-main.py
|— classes/
|   |— __init__.py
|   |— maze.py
|   |— player.py
|   |— enemy.py
```

Then your imports would change slightly:

```
python
```

```
from classes.maze import Maze
from classes.player import Player
from classes.enemy import Enemy
```

---

Would you like me to also show you a faster way to **split** the classes automatically inside PyCharm? (There's a neat trick!) 🌀

Sure.

Awesome! 😊 Here's how you can **split classes into separate files faster inside PyCharm**:

---

## ⚡ PyCharm Quick Way to Split Classes

---

1. Open `Maze-game.py` in PyCharm.
2. **Right-click** anywhere inside the class you want to move (e.g., `class Maze:`).
3. Select **Refactor > Move** (or just press **F6** 🔥 — shortcut for Move).
4. A dialog will pop up. It will say something like:

```
javascript
```

```
Move class 'Maze' to...
```

and suggest a new file like `maze.py`.

5. **Accept** or **edit the filename** if you want, then click OK.

6. PyCharm will automatically **create a new file**, move the class into it, **and fix imports** in your old file if needed.

---

### **Tip:**

- After moving, PyCharm usually offers to **optimize imports** (say yes).
- If it doesn't auto-fix imports in `Maze-game-main.py`, just manually import as we discussed earlier.

---

### **Summary**

Using **F6 (Move)** in PyCharm:

Move class → auto-create file → auto-fix code =  super fast cleanup.

---

Would you also want me to show you how to **bundle all classes into a single `classes` package** automatically if you have many classes? (That's another power trick.) 

Want me to?
